SYNTHESIS AND BRIDGEHEAD REACTIONS OF 9-SUBSTITUTED 5,6,7,8,9,10-HEXAHYDRO-5,9-METHANOPYRIMIDO[4,5-b]AZOCIN-4(3H)-ONES

Edward C. Taylor* and Beena Bhatia§

Abstract - The condensation of a variety of 6-amino-4(3H)-pyrimidinones with 2-cyclohexen-1-one in water, and replacement of the bridgehead 9-hydroxy group in the resulting Michael/cyclization adducts with carbon nucleophiles, are described. These reactions have been exploited for the preparation of a novel bridged tricyclic analog of 5,10-dideaza-5,6,7,8-tetrahydrofolic acid (DDATHF).

6-Amino-4(3H)-pyrimidinones behave as enamines, with electrophilic reactions such as nitrosation, nitrination, acylation and diazo coupling taking place at C-5. Michael reactions have also been observed to take place at C-5. Unsaturated carbonyl compounds lead directly to condensed pyrimidines such as pyrido[2,3-d]pyrimidines and quinolino[2,3-d]pyrimidines (or their dihydro derivatives) by intramolecular cyclization of the initial Michael adducts through participation of the pyrimidine 6-amino grouping. Activated azo compounds (diethyl azodicarboxylate, 4-phenyl-1,2,4-triazoline-3,5-dione) can also react as Michael acceptors to give 5-hydrazino derivatives that serve as versatile intermediates for the synthesis of purines, isoalloxazines, alloxazines, toxoflavins, and fervenulins. Michael addition of nitrosoolefins (prepared in situ by dehydrohalogenation of -halo oximes) and of nitro olefins are also known, and lead through subsequent transformations of the initial Michael adducts to pyrrolo[2,3-d]pyrimidines, following the above mentioned intramolecular participation of the pyrimidine-6-amino group.

![Chemical Structures](image)
We recently reported an extension of this Michael addition/cyclization concept to the sodium methoxide-promoted reaction of 2,6-diamino-4(3\(H\))-pyrimidinone (1a) with 2-cyclohexen-1-one (2). The initially formed Michael adduct (3) undergoes irreversible hemiaminal formation through intramolecular cyclization of the cyclohexanone carbonyl group with the 6-amino pyrimidine substituent to give the novel tricyclic azabicyclo[3.3.1]nonane structure (4a). We have also described a number of subsequent transformations of 4a involving conversion to (5), and replacement of the hemiaminal –OH group by –SR, -OR, and -NR\(_2\) via a 2-azabicyclo[3.3.1]non-1-ene anti-Bredt bridgehead imine intermediate. In view of the overall structural resemblance between these derivatives of 4a (such as 5) and Huperazine A (6) as well as initial molecular modeling studies indicating that 5 appears to match trimethoprim reasonably well as a ligand for the active site of \(P\). carinii \text{DHFR}, we have studied several additional aspects of the chemistry of these readily available tricyclic compounds, with the results reported herein.

Condensation of 1a with 2-cyclohexen-1-one (2) to give 4a, as carried out in our initial studies, was promoted by sodium methoxide in methanol, but other 6-aminopyrimidines failed to react under these conditions. We have now found that this reaction can be carried out very effectively simply by heating the reactants in water, and that these conditions are successful with a variety of 6-aminopyrimidines (see Table 1). Yields are generally good, and the products are readily obtained by cooling and filtering the aqueous reaction mixture. Although 2,4,6-triaminopyrimidine (1g) failed to react with 2 in aqueous solution, the reaction proceeded successfully in glacial acetic acid to give 4g, as noted previously.

We have now extended to carbon nucleophiles the protocol previously employed for replacement of the tertiary hemiaminal –OH grouping in 4a with –SH, -OR, -NR\(_2\) and –H. Reaction of the N,O-dipivaloyl derivative(7) with Grignard reagents (ethylnylmagnesium bromide, ethylmagnesium bromide, benzylmagnesium bromide, allylmagnesium bromide) resulted in smooth introduction of the corresponding carbon nucleophile into the tertiary position to give 8a-d. The bridgehead allyl derivative (8a) was subjected to a palladium-catalyzed Heck coupling with diethyl 4-iodobenzoyle-L-glutamate to give 11. General Procedure for the Preparation of 8a-d and 10a-d:
The appropriate Grignard reagent (in THF or ether solution, 5 eq.) was added dropwise to the solid 9-pivaloyloxy derivatives (7) and (9) at 0 °C, and the resulting mixture was stirred for 1 h. The reaction mixture was then partitioned between EtOAc (20 mL) and saturated aq. NH₄Cl solution (20 mL) and the aqueous phase was extracted with an additional 20 mL of EtOAc. The combined organic phases were washed with 20 mL of a saturated aq. NaCl solution, dried over MgSO₄, filtered and concentrated in vacuo. The C-9 alkylated products were obtained as colorless solids by purification of the residual solid by column chromatography using 2-5% MeOH/CH₂Cl₂ as eluent.
