Abstract - An efficient method for the synthesis of 1H-isoindole derivatives is described. It is based on iodine mediated cyclization of aryl(or alkyl)(2-vinylbenzyliden)amine derivatives, which can be easily prepared from the reactions of 2-lithiostyrene derivatives with various nitriles, furnishing the corresponding iodoamination products, 3-aryl(or alkyl)-1-iodomethyl-1H-isoindole derivatives, in satisfactory overall yields.

Current efforts in our laboratory focus on the development of convenient methods for the synthesis of fused heterocyclic compounds utilizing styrene derivatives carrying an appropriate functional group at the 2-position.1 We have recently demonstrated that iodine mediated cyclization of styrene derivatives bearing appropriate groups containing an NH moiety at the 2-position affords the corresponding fused nitrogen heterocycles.2 In studies designed to further explore the utility of the iodine mediated cyclization in the synthesis of fused nitrogen heterocycles, we examined reactions of aryl(or alkyl)(2-vinylbenzyliden)amine derivatives (2), which could be easily prepared by treatment of 2-lithiostyrene derivatives with various nitriles, with iodine. We found that the reactions gave 1-iodomethyl-1H-isoindole derivatives (3). This is a rare example of the cyclization by attack of imino nitrogen on an iodonium ion, though Larock et al. have reported a synthesis of 4-iodoisouquinolines by iodine mediated cyclization of tert-butylimines of o-(1-alkynyl)benzaldehydes.3 Displacement of the iodo moiety with hydrogen or sulfonyl groups proved to be achieved successfully to afford 1,1-dimethyl-1H-isoindole (4) or 1-sulfonylmethyl-1H-isoindole derivatives (5), respectively. The purpose of this paper is to disclose the results of these reactions, which provide a facile method for the construction of 1H-isoindole derivatives. Several methods for the preparation of 1H-isoindole derivatives have been reported.4 These are based on electrophilic ring closure of 2-azaallenium salts,4c rearrangement of 3-arylisoquinolin-4(1H)-ones,4d and heat or microwave irradiation of ortho-substituted aryl-oximes.4e Therefore, development of any new and simple method is meaningful, because this class of molecules may be of biological interest.
The synthesis of 1H-isoindole derivatives (3), (4), and (5) from 2-bromostyrene derivatives 1 were conducted through formation of 2-vinylbenzylidenamine derivatives (2), as illustrated in Scheme 1. The 2-vinylbenzylidenamine derivatives (2) were prepared by treatment of 2-lithiostyrene derivatives, which were generated from the bromine-lithium exchange between 2-bromostyrene derivatives (1) and butyllithium, with various nitriles. After usual aqueous workup, these imine derivatives (2) were used in the next iodoamination step without any purification. Thus, treatment of the crude products (2) with iodine in acetonitrile in the presence of sodium hydrogencarbonate provided the corresponding 1-iodomethyl-1H-isoindoles (3) in generally satisfactory overall yields from 2-bromostyrene derivatives (1) as summarized in the Table 1. An aliphatic nitrile, such as 2-methylpropanenitrile, was usable in this procedure (Entry 5), but the yield of the desired product (3e) was rather lower than those of aryl cyanides, because the iodoamination reaction gave a somewhat complicated mixture of products.

We next examined the reduction of the iodo moiety of 1-iodomethyl-1H-isoindoles (3). First, 1-iodomethyl-1-methyl-3-phenyl-1H-isoindole (3a) was allowed to react with tributyltin hydride in benzene. The reaction, however, resulted in complete recovery of the starting material even in the presence of a catalytic amount of AIBN at reflux temperature. Later, the reduction of 3a was found to be accomplished by employing sodium cyanoborohydride. Thus, compound (3a) was treated with this reagent in HMPA at 120 °C to give the desired product, 1,1-dimethyl-3-phenyl-1H-isoindole (4a), in moderate-to-fair yield (Table 1, Entry 1). In this manner, other 1-iodomethyl-1-methyl-1H-isoindoles (3b-d) were converted into the corresponding 1,1-dimethyl-1H-isoindoles (4b-d), respectively, in comparable yields (Table 1, Entries 2–4). It is notable that reduction of 1-aryl-1-iodomethyl-1H-isoindole derivatives (3f-h) with sodium cyanoborohydride under the same reaction conditions was unsuccessful, affording an intractable mixture of products in each case. However, we have no explanation of the reason
for this.

ᵃIsolated yields from 1. ᵇIsolated yields. ᶜThe reduction was not carried out. ᵈAn intractable mixture of products was obtained.

Subsequently, to explore the utility of the 1-iodomethyl-1H-isoinole (3), a series of sulfenylation studies were conducted. It was found that the sulfenyl substitution of 3 proceeded successfully on treatment with sodium thiolates, generated by the reaction of various thiols with sodium hydride, in DMF at the temperature shown in Table 2, to afford the corresponding 1-sulfenylmethyl-1H-isoinole derivatives (5) in moderate to fair yields (Scheme 2). Heterocyclic thiols, such as pyridine-2-thiol and 4,6-dimethylpyrimidin-2-thiol, proved to be usable in this sulfenylation procedure (Entries 3 and 4, respectively). Unfortunately, however, no reaction was observed in the reaction of 3a with sodium N-methylacetoanilide at 80 °C, and raising the reaction temperature resulted in the decomposition of 3a.

![Scheme 2](image)

In conclusion, we have demonstrated a convenient synthesis of 1H-isoinole derivatives from readily available starting materials. Since the method is experimentally simple, it may be of value in heterocycle synthesis. Applications of the present methodology to the synthesis of 1H-isoinoles carrying various functional groups are currently underway in our laboratory.

**EXPERIMENTAL**

The melting points were determined on a Laboratory Devices MEL-TEMP II melting-point apparatus.
and are uncorrected. The IR spectra were recorded on a Shimadzu FTIR-8300 spectrometer. The \(^1\)H NMR spectra were determined using SiMe\(_4\) as an internal reference in CDCl\(_3\) with a JEOL ECP500 FT NMR spectrometer operating at 500 MHz or a JEOL LA400 FT NMR spectrometer operating at 400 MHz. The \(^13\)C NMR spectra were determined in CDCl\(_3\) using TMS as an internal reference with a JEOL ECP500 FT NMR spectrometer operating at 125 MHz. Low-resolution mass spectra were recorded on a JEOL JMS-AX505 HA spectrometer. Thin-layer chromatography (TLC) was carried out on Merck Kieselgel 60 PF\(_{254}\).

**Starting Materials.** 1-Bromo-2-(1-methylethenyl)benzene (1a),\(^6\) 1-bromo-2-(1-phenylethenyl)benzene (1b),\(^7\) 1-bromo-2-[1-(4-chlorophenylethenyl)benzene (1c),\(^\text{th}^7\) 1-bromo-4-methoxy-2-(1-methylethenyl)benzene (1e),\(^\text{ta}^7\) and (2-bromophenyl)(4-methoxyphenyl)methanone\(^8\) were prepared by the appropriate reported procedures. All other chemicals used in this study were commercially available.

**1-Bromo-2-[1-(4-methoxyphenyl)ethenyl]benzene (1d).** This compound was prepared by treating (2-bromophenyl)(4-methoxyphenyl)methanone\(^8\) with methylenetriphenylphosphorane in THF at 0 °C in 74% yield; a colorless oil; \(R_f\) 0.47 (1:3 CH\(_2\)Cl\(_2\)-hexane); IR (neat) 1605 cm\(^{-1}\); \(^1\)H NMR (500 MHz) \(\delta\) 3.80 (3H, s), 5.15 (1H, d, \(J = 0.9\) Hz), 5.74 (1H, d, \(J = 0.9\) Hz), 6.83 (2H, d, \(J = 8.7\) Hz), 7.19–7.22 (3H, m), 7.30–7.35 (2H, m), 7.59 (1H, dd, \(J = 7.8, 1.4\) Hz). Anal. Calcd for C\(_{15}\)H\(_{13}\)BrO: C, 62.30; H, 4.53. Found: C, 62.03; H, 4.60.

**Typical Procedure for the Preparation of 1-Iodomethylisoindoles (3).** 1-Iodomethyl-1-methyl-3-phenyl-1H-isoindole (3a). To a stirred solution of 1-bromo-2-(1-methylethenyl)benzene (1a) (0.54 g, 2.7 mmol) in Et\(_2\)O (5 mL) at 0 °C was added \(n\)-BuLi (1.6 M in hexane; 2.7 mmol) dropwise. After 1 h stirring, PhCN (0.28 g, 2.7 mmol) was added, and stirring was continued for an additional 20 min before saturated aqueous NH\(_4\)Cl (15 mL) was added. The organic materials were extracted with Et\(_2\)O three times (10 mL each), and the combined extracts were washed with brine and dried over anhydrous Na\(_2\)SO\(_4\). Evaporation of the solvent gave crude \(C\)-[2-(1-methylethenyl)phenyl]-C-phenylmethyleneamine (0.54 g),
which was dissolved in MeCN (5 mL) and NaHCO₃ (0.62 g, 7.4 mmol) was added. Then, I₂ (1.9 g, 7.4 mmol) was added in portions under stirring at 0 °C. After 20 min, 10% aqueous Na₂S₂O₃ was added until the color of iodine disappeared. Acetonitrile was evaporated, and the resulting mixture was extracted with Et₂O three times (10 mL each). The combined extracts were washed with saturated aqueous NaHCO₃ twice and brine once, and dried over anhydrous K₂CO₃. Evaporation of the solvent gave a residue, which was purified by preparative TLC on silica gel to afford 3a (0.64 g, 68%); a yellow oil; Rf 0.26 (1:3 THF–hexane); IR (neat) 1618 cm⁻¹; ¹H NMR (500 MHz) δ 1.78 (3H, s), 3.74 (1H, d, J = 9.6 Hz), 3.80 (1H, d, J = 9.6 Hz), 7.24 (1H, ddd, J = 8.2, 7.3, 1.4 Hz), 7.30 (1H, ddd, J = 7.8, 7.3, 1.4 Hz), 7.43 (1H, td, J = 7.3, 0.9 Hz), 7.47 (1H, ddd, J = 7.8, 7.3, 1.4 Hz), 7.50–7.57 (3H, m), 7.79 (1H, td, J = 7.3, 1.8 Hz); MS (EI) m/z 365 (M⁺, 17), 238 (100). Typical Procedure for the Preparation of 1-Sufenylmethylisoindoles (5). 1-Methyl-3-phenyl-1-phenylthiomethyl-1H-isindole (5a). To a stirred suspension of NaH (60% in oil; 18 mg, 0.45 mmol) in DMF (2 mL) at rt was added PhSH (50 mg, 0.45 mmol). After stirring for 15 min, a solution of 3a (0.14 g, 0.41 mmol) in DMF (3 mL) was added, and stirring was continued for an additional 2.5 h at the same temperature. Saturated aqueous NH\(_2\)Cl (10 mL) was added and the resulting mixture was extracted with Et\(_2\)O three times (10 mL each). The combined extracts were washed with water twice and brine once, and dried over anhydrous Na\(_2\)SO\(_4\). Evaporation of the solvent gave a residue, which was purified by preparative TLC on silica gel to afford 5a (0.11 g, 77%); a yellow oil; \( R_f 0.32 \) (1:4 AcOEt–hexane); IR (neat) 1605 cm\(^{-1}\); \(^1\)H NMR (500 MHz) \( \delta \) 1.68 (3H, s), 3.58 (1H, d, \( J = 12.8 \) Hz), 3.59 (1H, d, \( J = 12.8 \) Hz), 7.11 (1H, t, \( J = 7.3 \) Hz), 7.17 (2H, dd, \( J = 7.8, 7.3 \) Hz), 7.22 (2H, d, \( J = 7.8 \) Hz), 7.35 (1H, t, \( J = 7.3 \) Hz), 7.40 (1H, t, \( J = 7.3 \) Hz), 7.49–7.52 (4H, m), 7.75 (1H, d, \( J = 7.3 \) Hz), 7.85 (2H, dd, \( J = 7.3, 1.8 \) Hz); MS (EI) \( m/z \) 329 (M\(^+\), 46), 283 (65), 206 (100).
