Abstract - Esters of substituted β-amino-α,β-dehydro-α-amino acids 5 were prepared either by transformation of N-heteroaryl-N,N-dimethylformamidines 2 with 3 into 4, followed by ring opening, or by treatment of primary or secondary amines 1 with 9.

Recently, the synthesis of novel α-amino acids and dipeptides became of considerable interest, since some of these compounds exhibit ACE inhibition and antihypertensive activity. On the other hand, many nonproteinogenic amino acids, such as β-amino acids, aromatic and heterocyclic amino acids have been isolated as secondary metabolites from various natural sources and α,β-dehydroamino acids as components of microbial metabolites. General methods for the preparation for majority of these compounds have not been described in the literature.

N'-Heteroaryl-N,N-dimethylformamidines are important class of compounds, since they undergo a variety of reactions in which the dimethylamino group is substituted with nucleophiles to give intermediates in the formation of various heterocyclic systems.

In this communication we report on two methods, according to which esters of substituted β-amino-α,β-dehydro-α-amino acids can be obtained:

Method A: In the reaction of N'-heteroaryl-N,N-dimethylformamidines 2, prepared from heterocyclic amines 1 (R¹=heteroaryl, R²=H) and N,N-dimethylformamide dimethyl acetal (DMFDMA), with 5-oxo-2-phenyl-1,3-oxazole (3) in the presence of acetic anhydride the corresponding heteroarylaminomethyleneoxazoles 4 are formed. They exist in tautomeric form 4b as shown on the basis of 1H nmr data supported by methylation with DMFDMA to give 4b (R¹=heteroaryl, R²=Me). The compounds 4b (R¹=heteroaryl,
$R^2=H$) can be further transformed with sodium methoxide in methanol into methyl esters of $\beta$-heteroarylmino-\(\alpha,\beta\)-dehydro-$\alpha$-amino acid derivatives 5, which exist in (Z)-form as shown by X-ray analysis. However, in some instances, cyclization into fused pyrimidines occurs in this transformation. For example, when 4b ($R^1=6$-chloropyridazinyl-3, $R^2=H$) was treated with sodium methoxide in methanol, pyrimido/1,2-b/pyridazine derivative 6 was produced. Furthermore, the method is limited to the primary, mostly heterocyclic, amines from which the corresponding formamidines 2 can be obtained.

In order to avoid the limitations, mentioned above, another method was developed in which the primary and secondary amines can be used.

Method B: Methyl 2-benzoylamino-3-dimethylaminopropenoate (9), prepared previously in a two-step reaction from hyppuric acid (7) by treatment with DMF and POCI$_3$ to give 8, followed by methanolsysis, can be obtained in a one-step reaction from 7 by treatment with DMFDMA. This, when treated with primary or secondary heterocyclic, aromatic or aliphatic (saturated heterocyclic) amines, produced the compounds 5 or 10. (Scheme 1).

EXPERIMENTAL

Melting points were taken on a Kofler micro hot stage. $^1$H nmr spectra were obtained on a JEOL C 60 HL or 900 FT spectrometers with TMS as internal standard and elemental analyses for C, H, and N on a PERKIN-ELMER CHN Analyser 240 C.

2-Phenyl-4-heteroarylamino)methylene-5(4H)-oxazolones 4b ($R^1$=heteroaryl, $R^2=H$).

To a stirred solution of 2 ($R^1$=heteroaryl, $R^2=H$) (0.001 mole) in acetic anhydride (4 ml) 3 (0.001 mole) was added and the mixture was heated at 70°C (2 h). The volatile components were evaporated in vacuo to give 4b. The following compounds were prepared in this manner:
