Abstract - An asymmetric synthesis of (+)-indolizidine 195B (1) starting from the known pyrrolidino alcohol (2) available from L-norleucine has been achieved.

The widespread occurrence and diverse biological activity of indolizidine alkaloids and the short supply of many of them from natural sources have made them attractive research objectives. In continuation of a study in our laboratory on developing synthetic entries into optically active alkaloids, we have been interested in a new approach to homochiral (+)-indolizidine 195B (1), extracted from the skin of the Colombian poison-frog Dendrobates histrionicus as a new alkaloidal component. So far, only two procedures have been reported, both by the Kibayashi group. The first enantiospecific synthesis of 1 was achieved from diethyl L-tartrate, which permitted the absolute stereochemistry to be assigned as 3S,5S,8aS. Additionally, his group has very recently succeeded in an excellent enantiomeric synthesis of 1 from C2-symmetric, chiral diepoxides available from D-mannitol. However, the approach has required relatively lengthy sequences from chiral educts, and this prompted us to disclose our short synthesis of (+)-indolizidine 195B (1) from the known (2S,5R)-1-benzyloxycarbonyl-2-buty1-5-hydroxymethylpyrrolidine (2) available from L-norleucine.
Recent investigations in this laboratory have revealed that the homochiral trans-2-alkyl-5-hydroxy-methylpyrrolidines (23d and 3a) prepared by a stereoselective intramolecular amidomercuration of N-alkenylurethanes available from α-amino acids serve as a versatile chiral building block in the preparation of several biologically active nitrogen-containing compounds such as (+)-pyrrolidine 197B and (+)-xenovenine.8

![Diagram of L-norleucine and D-alanine reactions](image)

The Swem oxidation (DMSO/COCl2/Et3N) of 2 gave the aldehyde (4), and the Wittig reaction of 4 with 3-benzyloxypropyldienetriphenylphosphorane, generated in situ from the appropriate phosphonium bromide and n-butyllithium (n-BuLi), afforded the olefin (5) in 70% yield from 2. Catalytic hydrogenation (H2/10%Pd/C/HCl-MeOH) of 5 followed by benzyloxyacylationation of the resulting pyrrolidin alcohol provided the N-protected alcohol (6) \([\alpha]_{25}^D + 59.9^\circ (c 0.970, CHCl3)\), lit.6b \([\alpha]_{25}^D + 60.4^\circ (c 5.90, CHCl3)\) in 57% yield. The Swem oxidation of 6 and subsequent reaction of the resulting aldehyde with methyltriphenylphosphorane gave the olefin (7) in 71%. The Wacker oxidation of 7 afforded the methyl ketone (8) in 77% yield. Finally, hydrogenation (H2/Pd(OH)2) of 8 resulted in cyclization to produce (+)-indolizidine 195B \([\alpha]_{25}^D + 99.6^\circ (c 0.23, MeOH)\), lit.6b \([\alpha]_{24}^D + 98.0^\circ (c 0.30, MeOH)\) and its C-5 epimer (9) in a ratio of 5:1 in 89% yield.

The spectral data for the synthesized compound (1) were identical with the values reported.6b

In summary, we have demonstrated a useful, short synthesis of (+)-indolizidine 195B (1) starting from the readily available, substituted pyrrolidine (2). This procedure could be applied to the synthesis of the 3,5-disubstituted indolizidine subclass. In practice, starting from the pyrrolidine alcohol (6) as the common chiral building block, both (-)-indolizidine 223AB and (-)-indolizidine 239AB or other 3,5-disubstituted indolizidines have been prepared by Kibayashi.6b The extension of this methodology to the synthesis of naturally scarce alkaloids is the subjects of active investigations in our laboratory, the results of which will be reported in due course.
EXPERIMENTAL

Microanalyses were performed by Microanalysis Center of Toyama Medical & Pharmaceutical University. Infrared spectra (ir) were measured with a Perkin-Elmer 1600 series FTIR spectrophotometer. Proton magnetic resonance (1H nmr) spectra were recorded at 270 MHz on a JEOL-FX270 instrument with tetramethylsilane as an internal standard. Carbon-13 nmr spectra were determined on a JEOL-FX270 instrument with tetramethylsilane as an internal standard unless otherwise specified. Mass spectra (ms) and high resolution mass spectra (HRms) were measured on a JEOL JMS D-200 spectrometer. Optical rotations were measured on a JASCO DIP-140 instrument. Chromatography was performed on a silica gel column [Fuji-Davision BW-200 or Merck 60 (No. 9385)] with a medium pressure apparatus and a mixture of ethyl acetate and hexane was used as eluant unless otherwise specified. The extracts were dried over Na2SO4 unless otherwise specified.

(2R,5S)-2-(4-Benzoyloxy-1-butenyl)-1-Benzoyloxycarbonyl-5-butylpyrrolidine (A mixture of E and Z) (5). To a solution of oxalyl chloride (160 µl, 1.64 mmol) in CH2Cl2 (1.6 ml) was added dropwise DMSO (306 µl, 2.15 mmol) at -78 °C. After being stirred for 10 min, a solution of (2S,5S)-2-Benzoyloxycarbonyl-3-butyl-5-hydroxymethylpyrrolidine (2) (318 mg, 1.09 mmol) in CH2Cl2 (7 mL) was added to the mixture. After being stirred at -60 °C for 30 min, triethylamine (684 ml, 4.91 mmol) was added to the mixture. The reaction mixture was warmed to 0 °C and then quenched with 20% KHSO3. The mixture was extracted with CH2Cl2. The extract was washed with sat. NaHCO3 and then brine, dried, and evaporated.
The residue was chromatographed to yield the aldehyde (4) (297 mg, 94%). To a solution of benzylxoypropyltriphenylphosphonium bromide (1.6 g, 3.25 mmol) in THF (3.5 ml) was added n-BuLi (1.6 M in hexane) (1.68 ml, 2.70 mmol) at -78 °C. The reaction mixture was gradually warmed to room temperature and then stirred for 30 min. A solution of 4 in THF (1 ml) was added dropwise to the mixture at 0 °C and the resulting mixture was stirred at 0 °C for 3 h. The mixture was quenched with sat. NH₄Cl and extracted with ether. The organic phase was washed with brine, dried, and evaporated. The residue was chromatographed to yield 5 (315 mg, 69%) as an oil. IR (νat) 3356, 1718, 1700 cm⁻¹; ¹H nmr (CDCl₃) δ 0.89 (3 H, m), 1.29 (4 H, m), 1.50-2.11 (8 H, m), 2.12-2.61 (2 H, m), 3.38 (2 H, m), 3.88 (1 H, m), 4.46 (2 H, m), 4.57 (1 H, m), 5.06 (2 H, m), 5.39 (2 H, m), 7.39 (10 H, m). Anal. Calcd for C₂₇H₃₅N⁰₃: C, 76.92; H, 8.37; N, 3.32. Found: C, 77.07; H, 8.40; N, 3.21.

(2S,5S)-1-Benzylxocarbonyl-2-butyl-5-(4-hydroxybutyl)pyrrolidine (6). A suspension of 5 (260 mg, 0.619 mmol) and 10% palladium carbon (30 mg) in 2% HCl in MeOH (5 ml) was stirred under a hydrogen atmosphere at 3 atm for 20 h. The insoluble materials were removed by filtration and washed with CH₂Cl₂. The combined organic phases were evaporated and 2N NaOH was added to the residue. The mixture was extracted with CH₂Cl₂. The extract was dried and evaporated to yield the crude product. Benzylxocarbonyl chloride (88 μl, 0.619 mmol) was added to a solution of a crude amino alcohol and 2N NaOH (619 μl, 1.24 mmol) in THF (3 ml) at 0 °C. After being stirred for 2 h, ethyl acetate and anhyd. Na₂SO₄ was added to the mixture. After filtration, the filtrate was evaporated to yield a residue, which was chromatographed to give 6 (118 mg, 57%) as an oil; [α]D²⁶ +59.9° (c 0.97, CHCl₃); ir (neat) 3448, 1697 cm⁻¹; ¹H nmr (CDCl₃) δ 0.82, 0.89 (3 H, 1:1 ratio, t, J=6.9 Hz), 1.10-2.03 (17 H, m), 3.52, 3.64 (3 H, 1:1 ratio, t, J= 6.9 Hz), 3.83 (2 H, m), 5.05, 5.06 (1 H, 1:1 ratio, ABq, J= 12.4 Hz), 5.18, 5.20 (1 H, 1:1 ratio, ABq, J= 12.4 Hz), 7.35 (5 H, m). Anal. Calcd for C₂₀H₃₁N⁰₃: C, 72.05; H, 9.37; N, 4.20. Found: C, 71.83; H, 9.23; N, 4.17.

(2S,5S)-1-Benzylxocarbonyl-2-butyl-5-(4-pentenyl)pyrrolidine (7). According to the procedure described for 5, treatment of 6 (131 mg, 0.393 mmol) with oxalyl chloride (68.3 μl, 0.786 mmol), DMSO (96 μl, 1.178 mmol), and triethylamine (246 μl, 1.768 mmol) in CH₂Cl₂ (2.6 ml) gave crude aldehyde. To a solution of methyltriphenylphosphonium bromide (281 mg, 0.786 mmol) in THF (600 μl) was added n-BuLi (1.6 M in hexane) (442 μl, 0.707 mmol) at 0 °C. After being stirred for 1 h, a solution of the crude aldehyde in THF (400 μl) was added dropwise to the mixture at 0 °C and the resulting mixture was stirred at 0 °C for 2 h. The mixture was quenched with sat. NH₄Cl and extracted with ether. The organic phase was washed with
brine, dried, and evaporated. The residue was chromatographed to yield 7 (92 mg, 71%) as an oil. \([\alpha]_D^{26} +62.8^\circ \) (c 3.045, CHCl₃); ir (neat) 1700, 1638 cm⁻¹; \(^1\)H nmr (CDCl₃) \(\delta\) 0.83, 0.89 (3 H, 1:1 ratio, t, \(J = 6.6\) Hz), 1.14-1.47 (7 H, m), 1.47-1.74 (4 H, m), 1.82-2.18 (5 H, m), 3.76 (2 H, m), 3.77 (2 H, m), 4.91 (2 H, m), 5.03, 5.08 (1 H, 1:1 ratio, ABq, \(J = 12.4\) Hz), 5.17, 5.22 (1 H, 1:1 ratio, ABq, \(J = 12.4\) Hz), 5.78 (1 H, m), 7.35 (5 H, m). Anal. Calcd for C₂₁H₃₁N₂O₂: C, 76.55; H, 9.48; N, 4.25. Found: C, 76.82; H, 9.67; N, 4.10.

(2S,5S)-1-Benzoxycarbonyl-2-butyl-5-(4-oxopentyl)pyrrolidine (8). A suspension of PdCl₂ (4.9 mg, 0.028 mmol) and CuCl (27.6 mg, 0.279 mmol) in 223 µl of dimethylformamide-water (7:1) was bubbled with oxygen for 1 h. To the mixture was added a solution of 7 (92 mg, 0.28 mmol) in 75 µl of dimethylformamide-water (7:1). The reaction mixture was stirred under oxygen for 24 h, and then to this was added 3N HCl (1 ml). The aqueous layer was extracted with ether. The extract was washed with sat. NaHCO₃, dried, and evaporated. The residue was chromatographed to yield 8 (74 mg, 77%) as an oil; \([\alpha]_D^{26} +62.6^\circ \) (c 3.225, CHCl₃); ir (neat) 1696 cm⁻¹; \(^1\)H nmr (CDCl₃) \(\delta\) 0.82, 0.89 (3 H, 1:1 ratio, t, \(J = 6.9\) Hz), 1.14-2.63 (11 H, m), 2.04, 2.13 (3 H, 1:1 ratio, s), 3.68-3.92 (2 H, m), 5.03, 5.08 (1 H, 1:1 ratio, ABq, \(J = 12.4\) Hz), 5.16, 5.20 (1 H, 1:1 ratio, ABq, \(J = 12.4\) Hz), 7.35 (5 H, m). HRms calcd for C₂₁H₃₁NO₃: 345.2284. Found: 345.2302.

(3S,5S,8aS)-3-Butyl-5-methylindolizidine [[(+)-indolizidine 195B], 1] and (3S,5R,8aS)-3-Butyl-5-methylindolizidine (9). A suspension of 8 (127 mg, 0.368 mmol) and palladium hydroxide (13 mg, 0.093 mmol) in MeOH (5 ml) was stirred under a hydrogen atmosphere for 7 h. The insoluble materials were removed by filtration and the filtrate was evaporated to give a residue, which was chromatographed on basic alumina using hexane-CHCl₃ (1:3) as eluant to yield 1 (54 mg, 75%) and 9 (10 mg, 14%) as oils.
