Abstract - A new nitrogen-bridged annulenoannulenone, 3H-cyc[3.2.2]azino-[2,1-e]cyc[3.3.2]azin-3-one (10) was synthesized from bispyridylmethane (1) via cycloaddition reaction of indolizinquinolinizinium salt (6) with methyl acetylene-carboxylate (MAC) as the key step.

In view of the interest in heterocyclic annulene1-5 we have previously reported a new nitrogen-bridged heterocyclic system, cyclazine (cyc[3.2.2]azines,6 cyc[3.2.2]azinophanes,7 cyc[3.3.2]azinones,8 cyc[3.3.3]azines,9 benzocyc[3.2.2]azine,9 cyc[3.2.2]azino[1,2-a]cyc[3.2.2]azine10). However the literature was devoid of annulenoannulenone containing cyc[3.3.2]azinone nucleus which was characterized as a nitrogen-bridged annulenone. As a part of our continuing work on the synthesis of cyclazines, we have reported the synthesis of tetramethyl 3H-cyc[3.2.2]azino[2,1-e]cyc[3.3.2]azin-3-one-1,2,4,5-tetra-carboxytate in the preliminary communication.11 In this paper we wish to report a more detailed description of the earlier experiments, the synthesis of 3H-cyc[3.2.2]azino[2,1-e]cyc[3.3.2]azin-3-one (10) as the parent compound, and the examination of its 1H-NMR spectroscopy.

The starting bispyridylmethane (1) used in the present work was prepared according to Newkome’s method.12 The reaction of 1 with ethyl bromopyruvate in acetonitrile at room temperature for a week gave pyridylindolizine hydrobromide (2) in good yield. Treatment of the hydrobromide (2) with aq. K2CO3 afforded the free base, pyridylindolizine (3) which was allowed to react with ethyl bromoacetate in acetonitrile at room temperature for a week. The crude salt (4) resulted above was refluxed with triethylamine in EtOH to produce the cyclic ylide (5) in 93 % yield from 3. Heating of 5 in refluxing 47 % hydrobromic acid for 30 min gave the salt (6) through decarboxylation. After many attempts to obtain cyclazinocyclusazinones (8a,b), the synthesis of the desired compounds (8a,b) was achieved on employing the procedure of Farquhar.13 Reaction of 6 with methyl acetylene-carboxylate (MAC) in the presence of K2CO3 in nitrobenzene for 20 h at 120 °C gave methyl 3H-indolizinocyc[3.3.2]azin-3-one-5-carboxylate (7) and then heating of 7 with MAC in the presence of 5 % Pd-C in nitrobenzene under N2 atmosphere for 20 h at 100 °C afforded the desired annulenoannulenone, dimethyl 3H-cyc[3.2.2]azino[2,1-

e)cycl[3.3.2]azin-3-one-1,5-dicarboxylate (8a). On the other hand reaction of 6 with dimethyl acetylenedicarboxylate (DMAD) in the presence of K₂CO₃ in refluxing nitrobenzene for 20 h gave tetramethyl 3H-cycl[3.2.2]azino[2,1-e]cycl[3.3.2]azin-3-one-1,2,4,5-tetracarboxylate (8b). Hydrolysis of 8a using 30 % aq. NaOH in refluxing MeOH for 20 h followed by acidification with 10 % HCl gave the corresponding diacid (9). Decarboxylation of the diacid (9) was conducted by Cu₂O in boiling nitrobenzene for 30 h to afford the desired [10]annuleno[11]annulenone, cycl[3.2.2]azino[2,1-e]cycl[3.3.2]azin-3-one (10) in 33 % based on 8a.

The structure of 10 was supported by a satisfactory elemental analysis and the signals of eight doublets (7.13: C₃-H, J = 5 Hz; 7.37: C₁-H, J = 5 Hz; 7.86: C₆-H, J = 8 Hz; 8.10: C₁₁-H, J = 8 Hz; 8.15: C₂-H, J = 5 Hz; 8.17: C₄-H, J = 5 Hz; 8.20: C₈-H, J = 8 Hz; 8.40: C₉-H, J = 8 Hz) and two triplets (7.63: C₇-H, J = 8 Hz; 7.84: C₁₀-H, J = 8 Hz) in the ¹H-NMR spectrum. Cyclazinocyclazin-3-one (10) is yellow crystals and soluble in most of organic solvents giving orange solutions. It is stable to heat and light. The UV spectra of cyclazinocyclazin-3-one (10) and protonated cyclazinocyclazin-3-one (10⁺) are illustrated in Figure 2 and it is evident that protonation with the acid causes the main maxima to shift to higher wavelengths.

The ¹H-NMR spectra of cyclazin-3-one (11),¹³ cyclazinocyclazin-3-one (10) and deuteronated cyclazinocyclazin-3-one (10⁺) are shown in Figure 1. The ¹H-NMR spectra of 10 and 11 indicate the existence of a diamagnetic ring current, since the protons of 10 and 11 resonate at lower field than those of cycl[3.2.2]azine (12)¹⁰,¹⁴ (7.20-7.86 ppm). It has already been found that the diatropicity of a cycl[3.2.2]azine is considerably increased by fusion of a second cycl[3.2.2]azine ring as compared 12 with cycl[3.2.2]azinocycl[3.2.2]azine (13).¹⁰ It is evident from the ¹H-NMR spectra of 10 and 11 that fusion of a cycl[3.2.2]azine also induces the diamagnetic ring current of the cyclazin-3-one. As pointed out in previous papers,⁸,¹⁵,¹⁶ the diamagnetic ring current is increased when cyclazinocyclazinone (10) is protonated. Thus, when 10 is dissolved in CDCl₃ with CF₃COOD, the ¹H-NMR spectrum of 10⁺ shows downfield shifts as compared with 10.

EXPERIMENTAL

Melting points were determined with a Mitamura Mel-Temp and are uncorrected. IR spectra were recorded in KBr pellets on a IR 810 (JASCO) spectrophotometer. UV spectra were recorded on a UV-310 (Shimazu) spectrophotometer. ¹H-NMR and ¹³C-NMR spectra were obtained on a Gemini 300 (VARIAN) and a VARIAN UNITY plus 500 (VARIAN) spectrometer with tetramethylsilane as an internal standard.
Chemical shifts are reported in parts per million (δ). Elemental analyses (C,H,N) of all compounds described here were performed on a Yanagimoto MT-2 CHN recorder.

**Ethyl 1-(2-Pyridyl)indolizine-2-carboxylate Hydrobromide (2)**

To a solution of ethyl bromopyruvate (0.39 g, 2 mmol) in CH$_2$CN (10 mL) was added dropwise a solution of 1 (0.34 g, 2 mmol) in CH$_2$CN (3 mL) at 0 °C and the mixture was stirred for a week at rt. The resulting precipitates were collected by filtration, washed with CH$_2$CN, and recrystallized from MeOH to give 2.
