A NEW SYNTHESIS OF METATHIAZANONE DERIVATIVES

VIA INTRAMOLECULAR PUMMERER REARRANGEMENTS

Isao Nagakura, Hiroshi Oka, and Yoshihiro Nitta

Department of Synthetic Development, Kohjin Co. Ltd.,

A new synthesis of metathiazanone derivatives is described. The synthesis involves a novel, intramolecular Pummerer rearrangement.

The compound 2-(p-chlorophenyl)-3-methyl-4-metathiazanone (I) \(^1\text{-}^4\)
is an important synthetic precursor for the corresponding sulfoxide (II) \(^2,^5\) and sulfone (III) \(^2,^6\), both known muscle relaxants. Up to the present time, compound I has been synthesized by: (a) reaction of \(p\)-chlorobenzaldehyde with 3-mercapto-N-methylpropionamide or with 3-mercaptopropionic acid-methylamine \(^1,^2\) (b) reaction of N-(\(p\)-chlorobenzylidene)methylamine with 3-mercaptopropionic acid \(^1\), or (c) reaction of \(p\)-chlorobenzal chloride with 3-mercapto-N-methylpropionamide \(^4\). We here report a novel method for the synthesis of metathiazanone derivatives. The overall equation is illustrated

\[
\begin{align*}
\text{Cl} & \quad \text{CH}_3 \quad \text{O} \\
\text{Y} & \quad \text{Y} = \text{S} \\
\text{Y} & \quad \text{Y} = \text{SO} \\
\text{Y} & \quad \text{Y} = \text{SO}_2
\end{align*}
\]
in Scheme 1.\textsuperscript{7,8}

\begin{align*}
\text{IV} & \quad X = \text{Cl}, R = \text{CH}_3 \\
\text{V} & \quad X = \text{H}, R = \text{CH}_3 \\
\text{VI} & \quad X = \text{Cl}, R = \text{CH}_2\text{CH}_3 \\
\text{VII} & \quad X = \text{Cl}, R = \text{CH}_2\text{C}_6\text{H}_5
\end{align*}

\begin{align*}
\text{I} & \quad X = \text{Cl}, R = \text{CH}_3 \\
\text{VIII} & \quad X = \text{H}, R = \text{CH}_3 \\
\text{IX} & \quad X = \text{Cl}, R = \text{CH}_2\text{CH}_3 \\
\text{X} & \quad X = \text{Cl}, R = \text{CH}_2\text{C}_6\text{H}_5
\end{align*}

**SCHEME 1**

It is well known that the reaction of a dialkyl sulfoxide with acetic anhydride affords the corresponding $\alpha$-acetoxyl sulfide. This reaction, known as the Pummerer rearrangement,\textsuperscript{10,11} has been shown to take place via the pathway outlined in Scheme 2. On basis of this mechanism, it seemed reasonable to propose that rearrangement of a sulfoxide with an internal nucleophilic center suitably placed could result in intramolecular neutralization of the intermediate cation. To test this hypothesis, sulfoxide IV was heated with an excess of acetic anhydride in benzene for 1 h. During this time, the initial heterogeneous mixture became homogeneous. Purification
of the product by column chromatography (silica gel, 3:1 benzene-ethyl acetate) afforded, in 82% yield, 2-(p-chlorophenyl)-3-methyl-4-metathiazanone (I), m.p. 49-50; i.r. (KBr), $\nu_{\text{max}}$ 1656, 1390 cm$^{-1}$; n.m.r. (CDCl$_3$) $\delta$ 2.80 (m, 4H), 2.96 (s, 3H), 5.48 (s, 1H), 7.2-7.7 (m, 4H).

Oxidation of compound I with peracetic acid (1 equiv.) or with potassium permanganate (2 equiv.) yielded compounds II or III, respectively.$^{1,2}$

The synthetic method was extended to include the sulfoxides V - VII.

In each case, the corresponding metathiazanone derivative (VIII - X, respectively) was formed in reasonably good yield. The results are summarized in Table 1.

Table 1. Synthesis of Metathiazanone Derivatives (Scheme 1)

$^a$ Melting points are uncorrected. $^b$ Isolated yield.

$^c$ lit. $^1$ oil, b.p. 172-175° at 0.2 torr. $^d$ lit. $^1$ m.p. 95.2-96.2°

$^e$ lit. $^1$ m.p. 106-107.7°.

The starting materials (sulfoxides IV-VII) for the above-mentioned conversions were prepared as follows (see Scheme 3). Reaction of
the appropriate benzylmercaptan\textsuperscript{12} (XI, XII) with methyl acrylate in aqueous methanol in the presence of sodium hydroxide, followed by reaction of the resultant esters with the required primary amine, gave the sulfides XIII – XVI. Oxidation of these compounds with 1 equiv. of hydrogen peroxide in aqueous methanol yielded the corresponding sulfoxides IV–VII, respectively. The pertinent data is summarized in Table 2.
