1. General methods and materials

**General.** Infrared (IR) spectra were recorded on a JASCO FT/IR-4100 FT-IR spectrometer. $^1$H and $^{13}$C NMR spectra were recorded on a JEOL JNM-ECZ500R (500 MHz for $^1$H and 126 MHz for $^{13}$C) spectrometer. Chemical shifts ($\delta$) are reported in ppm referenced to tetramethylsilane as internal standard (CDCl$_3$: $\delta$ = 0 ppm for $^1$H) and residual solvent signal (CDCl$_3$: $\delta$ = 77.0 ppm for $^{13}$C{[$^1$H]}). J-values are given in Hz. The high-resolution mass spectra (HRMS) were obtained with a Shimadzu LCMS-IT-TOF mass spectrometer. Optical rotations were measured on a HORIBA polarimeter SEPA-300. HPLC analyses were performed on JASCO HPLC system (JASCO PU-2086Plus preparative HPLC pump and UV-2075Plus UV/Vis detector). All melting points were determined on a BÜCHI melting apparatus B540 and are uncorrected. All manipulations were carried out with standard Schlenk technique under an argon atmosphere. Reactions were monitored by TLC (silica gel 60 F$_{254}$, 0.25 mm) analysis. Flash column chromatography was performed on flash silica gel 60N (spherical neutral, particle size 40–50 μm).

**Materials.** Anhydrous CH$_2$Cl$_2$, THF, Et$_2$O, 1,4-dioxane, toluene, MeOH, and MeCN were purchased and used without any purification. Aldehydes (E)-1a–1f and 1i were prepared according to the procedure described in the literature. The following known compounds were prepared according to the procedure described in the literature.

- Benzyl 2-[hydroxy(phenyl)methyl]prop-2-enoate
- N-(2-Formylphenyl)-4-methylbenzenesulfonamide
- N-(5-Chloro-2-formylphenyl)-4-methylbenzenesulfonamide
- Methyl (2Z)-2-(bromomethyl)-3-phenylprop-2-enoate
- N-(4-Chloro-2-formylphenyl)-4-methylbenzenesulfonamide
- N-(6-Formyl-1,3-benzodioxol-5-yl)-4-methylbenzenesulfonamide
- N-(2-Formyl-5-methoxyphenyl)-4-methylbenzenesulfonamide
- N-(2-Formylphenyl)-2-nitrobenzenesulfonamide
- N-(2-Formylphenyl)-2,4,6-trimethylbenzenesulfonamide
- N-(2-Formylphenyl)-1-naphthalenesulfonamide

Racemic cycloadducts 3 were prepared according to the general procedure B in the presence of Cu complex prepared from Cu(MeCN)$_4$OTf and 1,3-bis(diphenylphosphino)propane (dppp) instead of Cu(MeCN)$_4$OTf and (S)-H8-binap L4. All other chemicals were purchased from commercial suppliers and used as received.
2. Experimental procedures

Preparation of benzyl (2Z)-2-(bromomethyl)-3-phenylprop-2-enoate.

Using the modified procedure in the literature, benzyl (2Z)-2-(bromomethyl)-3-phenylprop-2-enoate was prepared. To a solution of benzyl 2-[hydroxy(phenyl)methyl]prop-2-enoate \(^1\) (1.59 g, 5.93 mmol) and PPh\(_3\) (1.94 g, 7.17 mmol) in CH\(_2\)Cl\(_2\) (15.0 mL) was added CBr\(_4\) (2.33 g, 6.96 mmol) at 0 °C. The mixture was stirred at rt for 20 min. The reaction mixture was filtered through a short plug of silica gel, which was rinsed with \(n\)-hexane and EtOAc (4:1) to give benzyl (2Z)-2-(bromomethyl)-3-phenylprop-2-enoate (835.5 mg, 2.52 mmol, 42%) as pale yellow amorphous solid.

General procedure A for the preparation of aldehyde 1.

Using the modified procedure in the literature, aldehydes 1 were prepared. To a mixture of sulfonamide (1.0 eq) and K\(_2\)CO\(_3\) (1.3–1.6 eq) in MeCN was added a solution of 2-(bromomethyl)acrylate derivative (1.2–1.4 eq) in MeCN. The reaction mixture was stirred at rt. The reaction was quenched by the addition of water. The mixture was extracted with CH\(_2\)Cl\(_2\). The organic layer was washed with brine, dried over anhydrous Na\(_2\)SO\(_4\), and concentrated in \textit{vacuo}. The residue was purified by column chromatography on silica gel (\(n\)-hexane : EtOAc = 2 : 1) to give 1.
Methyl 2-\{\[N-(2-formylphenyl)-N-(4-methylbenzene-1-sulfonyl)amino\]methyl\}prop-2-enoate (1g).

To a round bottom flask charged with aldehyde 1 (0.10 mmol), glycine methyl ester hydrochloride (25.6 mg, 0.20 mmol), and anhydrous MgSO₄ (50.7 mg, 0.40 mmol) under the Ar atmosphere, dry CH₂Cl₂ (0.50 mL, 0.20 M) and DIPEA (35.1 µL, 0.20 mmol) were added. The reaction mixture was stirred at 30 °C for 4 h. The reaction mixture was filtered and washed with water. The aqueous layer was extracted with diethyl ether. The combined organic layer was washed with brine, dried over anhydrous Na₂SO₄, and concentrated in vacuo to give crude imine 2. To a Schlenk flask charged with Cu(MeCN)₄OTf (3.8 mg, 0.010 mmol), (S)-H8-BINAP L₄ (7.6 mg, 0.012 mol), and activated MS4A (80.0 mg) under the Ar atmosphere, dry 1,4-dioxane–toluene (4:1, 0.50 mL) were added. The reaction mixture was stirred at 30 °C for 30 min and cooled to 0 °C. To this mixture, the solution of crude imine 2a in dry 1,4-dioxane–toluene (4:1, 1.5 mL) was added. After addition of triethylamine (28.0 µL, 0.20 mmol), the entire mixture was stirred at 0 °C for 24 h. The reaction mixture was filtered through a short plug of silica gel, which was rinsed with n-hexane and EtOAc (1:1). The filtrate was evaporated in vacuo and the residue was purified by column chromatography on silica gel (n-hexane : EtOAc = 3:1 to 1:1) to afford 3.

3. X-ray crystallographic data for 3a

The single crystals of compound 3a (>99% ee) suitable for X-ray diffraction study were obtained by recrystallization from hexane, Et₂O and CH₂Cl₂ at rt. The X-ray diffraction experiment of 3a was conducted with CuKα radiation at 103.15 K. Using Olex2¹⁴, the structure was solved with the SHELXT¹⁵ structure solution program using Intrinsic Phasing and refined with the SHELXL¹⁶ refinement package using Least Squares minimization.
